

The DICO project: A Multimodal Menu-based In-vehicle Dialogue System

Staffan Larsson and Jessica Villing
Department of Linguistics, Göteborg University, Sweden

1 Introduction

Dico is a multimodal in-car dialogue system application¹. An obvious advantage of spoken dialogue in the vehicle environment is that the driver does not have to take the eyes - and the attention - off the road. DICO (with capital letters) is also a recently started research project, with funding from Vinnova, involving major Swedish industry players (Volvo, TeliaSonera) as well as the Dialogue Systems Lab at Göteborg University, and KTH in Stockholm.

In the original Dico application (Olsson and Villing, 2005), the dialogue system was able to control a cellphone. The main goal was to develop an interface that is less distracting the driver, and thus both safer and easier to use than existing interfaces. In an in-vehicle environment, it is crucial that the system is intuitive and easy to use. GoDiS' dialogue manager allows the user to interact more flexibly and naturally with menu-based interfaces to devices.

Today's vehicles typically contain several devices that the driver needs to control, many of them with menu-based interfaces. To show how a multimodal dialogue system can help when controlling several devices, Dico has been extended with a DID (Driver Information Display) and a radio.

2 GoDiS and TrindiKit

Dico is developed using the dialogue system GoDiS (Larsson, 2002). GoDiS is implemented using TrindiKit (Traum and Larsson, 2003). General dialogue management issues such as feedback, grounding, question accommoda-

¹The work reported here was funded by TALK (Talk And Look, Tools for Ambient Linguistic Knowledge), EC project IST-507802, and DICO, Vinnova project P28536-1

tion and task switching are handled by the application-independent dialogue manager. Re-using these technologies in new applications enables rapid prototyping of advanced dialogue applications. GoDiS has been adapted to several different dialogue types, domains, and languages, including menu-based multimodal dialogue when acting as an interface to an mp3 player (Hjelm *et al.*, 2005).

3 The Dico application

When the user starts Dico she is asked to choose one of the three applications. Later in the interaction she is allowed to switch to any application without having to return to the top application (Dico) first. The output in the radio and the DID applications is multimodal. The modalities, visual and acoustic, work in parallel in the sense that the same information is given on the screen and verbally.

The services offered by the cellphone application includes calling a name or a number, managing the phonebook, using the helper and changing the settings in the cellphone application. The phonebook options are searching, adding or deleting a name, number or number type. The helper contains the calendar, the alarm clock, the messages and the missed out calls. The user can search for, add or delete information in the calendar, these options can also be applied on the alarm clock. The messages and the missed out calls can be listened to. The settings that can be done are changing the ring tone, the volume or the PIN-code. It is also possible to search for available ring tones.

The radio station and the volume can be changed. It is also possible to ask for the current radio station and for available radio stations. In the DID application the truck driver can get information about the orders (such as where to pick-up and deliver goods) and information from the tachograph (driving, resting, working and waiting time).

4 GoDiS features in Dico

To enable a more natural and intuitive dialogue, GoDiS supports (among other things) accommodation, task switching and grounding.

4.1 Accommodation

Since the applications are based on existing menu interfaces, it is possible for the novice user to let the system take the initiative and guide the user through e.g. the phonebook menu. For expert users, accommodation enables skipping through the menus and getting right to the point. Instead of navigating through a complicated and tiresome menu structure it is possible for the expert user to give all information in one utterance:

Ex. 1:

“Call Lisa’s home number”

4.2 Multiple simultaneous tasks and task switching

It is possible to start one dialogue to perform a task, and then start a subdialogue before the first task is completed. When the second task is completed the system automatically returns to the first task. This gives the user freedom to switch task at any time:

Ex. 2:

U: “Change Lisa’s home number.”

S: “Okay. Let’s see. What phonenumber do you want instead?”

U: “Check my messages.”

S: “You have got this message. Hi! I have got a new home number, it is (031)234567. Best regards, Lisa.”

S: “Returning to change an entry. What phone number do you want instead?”

U: “oh three one twentythree fourtyfive sixtyseven.”

U: “Okay. Changing Lisa’s home number to oh three one two three four five six seven.”

4.3 Feedback and grounding

The GoDiS dialogue manager provides feedback to make sure that the dialogue partners have contact, that the system can hear what the user says, understands the words that are spoken (semantic understanding), understands the meaning of the utterance (pragmatical understanding) and accepts the dialogue moves performed in utterances.

Combining feedback on different levels makes it possible for the system to give explicit feedback on the user’s input. E.g. the single user utterance “Lisa” gives positive grounding on the semantic level but negative on the

pragmatic, resulting in a system utterance consisting of two feedback moves and a clarification question: “Lisa. I don’t quite understand. Do you want to add an entry to the phonebook, call a person, change an entry in the phonebook, delete an entry from the phonebook or search for a name?”

5 Future work

We plan to extend Dico to handle integrated multimodality on the input side. By “integrated multimodality” we mean that different modalities contribute to different parts of the dialogue, i.e. “*Play this [click]*” where the [click] is a mouse click at the selected song. Technologies for integrated multimodality in menu-based applications have already been developed for other GoDiS applications (Hjelm *et al.*, 2005) and these solutions will be re-used in Dico.

Ko *et al.* (2006) found that a context-aware dialogue system can reduce the degree of user distraction while driving. Techniques for adding awareness of the driver’s level of distraction to Dico, and adapting the dialogue accordingly (e.g. by pausing the dialogue when the driver’s distraction level is high and resuming it later), will be investigated in the ongoing DICO project.
